

Have We Reached Herd Immunity?

*Whole Population Already Affected, Not Just Those Tested
(The Denominator in determining the Survival Rate)*

BACKGROUND

First, this Corona Virus started in China and then spread all over the world, which is just like the annual flu (influenza) and the common cold. Second, it's also been since Jan 2020 (or 1.65 years as of this writing) and, thus, we should *not* think some people have not been exposed; which has never happened with the flu or common cold. Third, we were told this Covid-19 virus had a really high R_0 (R naught) value. Four, we were also told that you can only "Flatten-the-Curve", NOT "End-the-Curve".

RANDOM POPULATION TESTING

Yet, if anyone were to disagree on not using the entire USA population as the denominator for the Survival Rate, they should state what percentage of the USA has NOT been exposed.

Nevertheless, that would take another random population study like done by California, New York, and New Orleans back around May 2020, and that same study would say we were already at Herd Immunity back in 2020.
