

# VACCINE QUESTIONS

## **IF VACCINES WORK, WHY DO PEOPLE STILL GET THE FLU?**

Even with vaccines, is the Annual Flu always avoidable? What about the Common Cold? Is that realistically avoidable?

Next, vaccines have been around for 100 years, but did that ever stop the Annual Flu or Common Cold in nursing homes where most of the flu deaths are per year? And even after the Covid-19 Vaccines were released, aren't most of the Covid-19 deaths still in nursing homes and the co-morbid?

Hence, won't Covid-19 vaccines be no more effective than those vaccines preventing the Annual Flu deaths in nursing homes?
