

# LGBTQ Toddler Talk

And for your friends, family and medical students in toddler speak:

The orifice where #2 objects are expelled from has a far thinner skin than the orifice where babies come from. The orifice where babies come from also produces secretions to minimize friction and infections during baby making, also known as love making, which is very unlike the previously mentioned orifice.

That orifice, where #2 objects are expelled from, is meant to have objects pass in one direction only, and pass very infrequently. And certainly not in two directions, in and out. And certainly not at high speed, nor with high repetitions. Yet if this happens, then that 'thin' skin has a tendency to tear easily, e.g. medical micro tears leading to the tiny lgbt demographic (1-3%) that makes up at least 50% of the American HIV infections. Hence, blood to feces contact, which is a medically dangerous contact.

And just in case you didn't knowy, the orifice where #2 objects are expelled from....was "born that way".
